# **CS23336-Introduction to Python Programming**

Started on Tuesday, 15 October 2024, 7:06 PM

**State** Finished

Completed on Tuesday, 15 October 2024, 8:03 PM

**Time taken** 57 mins 10 secs **Marks** 10.00/10.00

**Grade 100.00** out of 100.00

#### Question 1

Correct
Mark 1.00 out of 1.00

Flag question

#### **Question text**

The program must accept N integers and an integer K as the input. The program must print every K integers in descending order as the output.

**Note**: If N % K != 0, then sort the final N%K integers in descending order.

#### **Boundary Condition(s):**

$$1 \le N \le 10^4$$
  
-99999 \in Array Element Value \in 99999

## **Input Format:**

The first line contains the values of N and K separated by a space. The second line contains N integers separated by space(s).

#### **Output Format:**

The first line contains N integers.

#### **Example Input/Output 1:**

Input:

7 3 48 541 23 68 13 41 6

Output:

541 48 23 68 41 13 6

**Explanation:** 

The first three integers are 48 541 23, after sorting in descending order the integers are **541 48 23**. The second three integers are 68 13 41, after sorting in descending order the integers are **68 41 13**.

The last integer is **6**.

The integers are 541 48 23 68 41 13 6

Hence the output is **541 48 23 68 41 13 6**.

Answer:(penalty regime: 0 %)

```
1 import re
   res=[]
3 a=input()
4 lis=re.findall(r'[0-9]+',a)
 5 a=input()
 6 integers=re.findall(r'[0-9]+',a)
7 split=len(integers)//int(lis[1])
8 x=0
9 ★ for i in range(split):
10
       temp=integers[x:x+int(lis[1])]
11
       temp.sort(reverse=True)
12
       res.extend(temp)
13
       x+=int(lis[1])
14 • if split*int(lis[1])!=len(integers):
       res.extend(integers[x::])
16 print(*res)
```

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

#### **Question 2**

Correct

Mark 1.00 out of 1.00

Flag question

#### **Question text**

Given two arrays of positive integers, for each element in the second array, find the total number of elements in the first array which are *less than or equal to* that element. Store the values determined in an array.

For example, if the first array is [1, 2, 3] and the second array is [2, 4], then there are 2 elements in the first array less than or equal to 2. There are 3 elements in the first array which are less than or equal to 4. We can store these answers in an array, answer = [2, 3].

#### **Program Description**

The program must return an array of m positive integers, one for each maxes[i] representing the total number of elements nums[i] satisfying  $nums[i] \le maxes[i]$  where  $0 \le i < n$  and  $0 \le i < m$ , in the given order.

The program has the following:

nums[nums[0],...nums[n-1]]: first array of positive integers
maxes[maxes[0],...maxes[n-1]]: second array of positive integers

#### **Constraints**

- $\cdot 2 \le n, m \le 10^5$
- ·  $1 \le nums[j] \le 10^9$ , where  $0 \le j < n$ .
- ·  $1 \le maxes[i] \le 10^9$ , where  $0 \le i < m$ .

Input Format For Custom Testing

Input from stdin will be processed as follows and passed to the program.

The first line contains an integer *n*, the number of elements in *nums*.

The next n lines each contain an integer describing nums[j] where  $0 \le j < n$ .

The next line contains an integer *m*, the number of elements in *maxes*.

The next m lines each contain an integer describing maxes[i] where  $0 \le i < m$ .

Sample Case 0

#### Sample Input 0

#### **Sample Output 0**

#### **Explanation 0**

We are given n = 4, nums = [1, 4, 2, 4], m = 2, and maxes = [3, 5].

- 1. For maxes[0] = 3, we have 2 elements in nums(nums[0] = 1 and nums[2] = 2) that are  $\leq maxes[0]$ .
- For maxes[1] = 5, we have 4 elements in nums(nums[0] = 1, nums[1] = 4, nums[2] = 2, and <math>nums[3] = 4) that are  $\leq maxes[1]$ .

Thus, the program returns the array [2, 4] as the answer.

Sample Case 1

# Sample Input 1

#### **Sample Output 1**

0

3

#### **Explanation 1**

We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].

- 1. For maxes[0] = 3, we have 1 element in nums(nums[0] = 2) that is  $\leq maxes[0]$ .
- 2. For maxes[1] = 1, there are 0 elements in *nums* that are  $\leq maxes[1]$ .
- 3. For maxes[2] = 7, we have 3 elements in nums(nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are  $\leq maxes[2]$ .

4. For maxes[3] = 8, we have 4 elements in nums(nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are  $\leq maxes[3]$ .

Thus, the program returns the array [1, 0, 3, 4] as the answer.

Answer:(penalty regime: 0 %)

```
1 num=[]
 2 maxe=[]
3 res=[]
 4 a=int(input())
 5 → for i in range(a):
 6
       x=int(input())
       num.append(x)
 8 b=int(input())
9 - for i in range(b):
10
       x=int(input())
11
       maxe.append(x)
12 * for i in maxe:
13
       s=0
14 ∞
       for j in num:

# **Question 4**

Correct

Mark 1.00 out of 1.00

#### **Question text**

Given a matrix mat where every row is sorted in **strictly increasing** order, return the **smallest common element** in all rows.

If there is no common element, return -1.

# Example 1:

# **Input:**

12345

4 5

2 4 5 8 10

3 5 7 9 11

1 3 5 7 9

# **Output:**

5

#### **Constraints:**

- 1 <= mat.length, mat[i].length <= 500
- $1 \le mat[i][j] \le 10^4$
- mat[i] is sorted in strictly increasing order.

Answer:(penalty regime: 0 %)

```
1 import re
 2 a=input()
3 row=int(a[0])
4 column=int(a[2])
5 matrix=[]
6 res=-1
7 ★ for i in range(row):
 8
        temp=input()
 9
        matrix.append(re.findall(r'[0-9]+',temp))
10 → for k in range(column):
11
        x=(matrix[0])[k]
12
        flag=0
13 🖘
        for i in matrix:
14 -
            if x in i:
15
               flag+=1
16 🖘
        if flag==row and res==-1:
17
           res=x
18 🖘
        elif flag==row and x<res:</pre>
19
           res=x
20 print(res)
```

Correct

Marks for this submission: 1.00/1.00.

#### Question 5

Correct

Mark 1.00 out of 1.00

Flag guestion

#### **Question text**

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the  $p^{th}$  element of the list, sorted ascending. If there is no  $p^{th}$  element, return 0.

#### **Example**

```
n = 20
```

$$p = 3$$

The factors of 20 in ascending order are  $\{1, 2, 4, 5, 10, 20\}$ . Using 1-based indexing, if p = 3, then 4 is returned. If p > 6, 0 would be returned.

#### **Constraints**

$$1 \le n \le 10^{15}$$

$$1 \le p \le 10^9$$

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

```
Sample Input 0
10
3
Sample Output 0
Explanation 0
Factoring n = 10 results in \{1, 2, 5, 10\}. Return the p = 3^{rd} factor, 5, as the answer.
Sample Case 1
Sample Input 1
10
5
Sample Output 1
Explanation 1
Factoring n = 10 results in \{1, 2, 5, 10\}. There are only 4 factors and p = 5, therefore 0 is returned as the answer.
Sample Case 2
Sample Input 2
Sample Output 2
Explanation 2
Factoring n = 1 results in \{1\}. The p = 1st factor of 1 is returned as the answer.
For example:
Input Result
10
       5
10
       0
       1
Answer:(penalty regime: 0 %)
   1 n=int(input())
    p=int(input())
   3 lis=[]
   4 = for i in range(1,n+1):
          if(n%i==0):
   6
              lis.append(i)
   7 * if p<=len(lis):
         print(lis[p-1])
   8
   9 <del>s</del> else:
   10
          print(0)
```

Flag question

#### **Question text**

Given an integer n, return an list of length n+1 such that for each i (0 <= i <= n), ans[i] is the number of 1's in the binary representation of i.

Example:

Input: n = 2

```
Output: [0,1,1]
Explanation:
0 --> 0
1 --> 1
2 --> 10

Example2:

Input: n = 5
Output: [0,1,1,2,1,2]
Explanation:
0 --> 0
1 --> 1
2 --> 10
3 --> 11
4 --> 100
5 --> 101
```

Note: Complete the given function alone

For example:

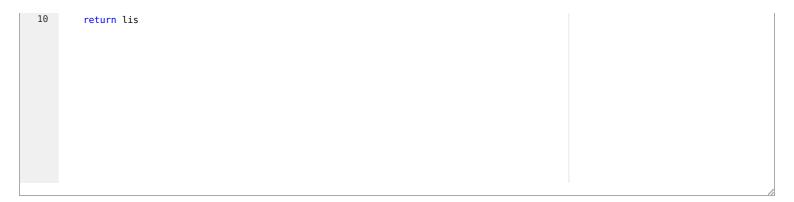

#### Test Result

```
print(CountingBits(5)) [0, 1, 1, 2, 1, 2]
```

Answer:(penalty regime: 0 %)

#### Reset answer

```
1 - def CountingBits(n):
2
        lis=[]
3 🤏
        for i in range(n+1):
4
            s=<mark>0</mark>
5 🖘
            while i>0:
6
                x=i%2
7
                 s+=x
8
                 i//=2
9
            lis.append(s)
```

Test	Expected	Got
<pre>print(CountingBits(2)) [0</pre>	, 1, 1] [0,	1, 1]
<pre>print(CountingBits(5)) [0</pre>	, 1, 1, 2, 1, 2] [0,	1, 1, 2, 1, 2]

Output

23 occurs 3 times

45 occurs 2 times

56 occurs 1 times

40 occurs 1 times

Answer:(penalty regime: 0 %)

```
1 n=int(input())
 2 lis=[]
3 set1={}
4 ⇒ for i in range(n):
5
       a=int(input())
       lis.append(a)
7 - for i in lis:
8 -
      if i in set1:
9
       set1[i]+=1
10 🖘
      else:
11
      set1[i]=1
12 = for i in set1:
13
      print(i,"occurs",set1[i],"times")
```
