# **CS23336-Introduction to Python Programming**

Started on Saturday, 26 October 2024, 12:17 PM

State Finished

Completed on Saturday, 26 October 2024, 12:58 PM

**Time taken** 40 mins 37 secs **Marks** 10.00/10.00

**Grade 100.00** out of 100.00

### **Question 1**

Correct
Mark 1.00 out of 1.00

Flag question

#### **Question text**

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

**Output Format:** 

Print the Distinct Elements in Array in single line which is space Separated

**Example Input:** 

3

12234

Output:

1234

**Example Input:** 

6

112233

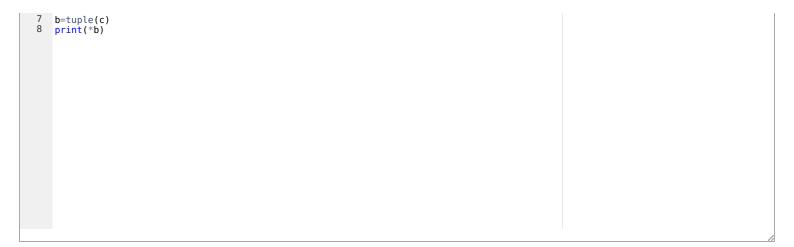

Output:

1 2 3

For example:

#### **Input Result**

5 1 2 2 1 2 3 4 3

Input	Expected	Got
5 1 2 2 3 4	1234	1234
6 1 1 2 2 3 3	123	123
5 11 22 11 22 11	11 22	11 22
10 1 2 3 4 5	1 2 3 4 5	12345

Passed all tests!

Correct

3

Marks for this submission: 1.00/1.00.

### **Question 2**

Correct

Mark 1.00 out of 1.00

Flag question

### **Question text**

You are given an integer tuple <code>nums</code> containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:

- 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
- 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

#### **Constraints**

- The input tuple nums contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple nums as input and return the total number of operations as an integer.

#### Example:

```
Input: nums = (3, 4, -1)
Output: 5

Explanation:

Operation 1: [3, 4, -1] -> First element is not the smallest, move to the end -> [4, -1, 3]

Operation 2: [4, -1, 3] -> First element is not the smallest, move to the end -> [-1, 3, 4]

Operation 3: [-1, 3, 4] -> First element is the smallest, remove it -> [3, 4]

Operation 4: [3, 4] -> First element is the smallest, remove it -> [4]

Operation 5: [4] -> First element is the smallest, remove it -> [1]

Total operations: 5
```

For example:

#### Test Result

```
print(count_operations((3, 4, -1))) 5
```

Answer:(penalty regime: 0 %)

```
Reset answer
```

```
1  def count_operations(nums: tuple) -> int:
        # Your implementation here
 3
         op=<mark>0</mark>
 4
        nums=list(nums)
 5 🤻
         while len(nums):
 6 🖘
             if(nums[0]==min(nums)):
 7
                 nums.remove(nums[0])
 8
                 op+=1
 9 🖘
             else:
10
                 t=nums[0]
11
                 nums.remove(t)
12
                 nums.append(t)
                 op+=1
13
14
         return op
```

# Feedback

Test	Expected	l Got
<pre>print(count_operations((3, 4, -1)))</pre>	5	5
<pre>print(count_operations((1, 2, 3, 4, 5)))</pre>	5	5
<pre>print(count_operations((5, 4, 3, 2, 1)))</pre>	15	15
<pre>print(count_operations((42, )))</pre>	1	1
<pre>print(count_operations((-2, 3, -5, 4, 1)))</pre>	11	11

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

#### **Question 3**

Correct

Mark 1.00 out of 1.00 Flag question

#### **Question text**

Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

#### In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

#### Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]

Example 2:
Input: words = ["omk"]
Output: []

Example 3:
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

#### For example:

#### **Input Result**

```
4
Hello Alaska
Dad Dad
Peace

2
adsfd afd
afd
```

```
1 a=int(input())
 2 b=()
3 b=list(b)
4 r1={'q','w','e','r','t','y','u','u','i','o','p'}
 5 r2={'a','s','d','f','g','h','j','k','l'}
 6 r3={'z','x','c','v','b','n','m'}
7 for i in range(a):
 8
       c=input()
9
       f=set(c.lower())
10 🖘
       if f.issubset(r1):
11
       b.append(c)
12 ∞
      elif f.issubset(r2):
13
         b.append(c)
14 - if len(b)!=0:
15 🖘
       for i in b:
16
          print(i)
17 ▼ else:
18
       print("No words")
```

#### Input Expected Got

```
Hello
Alaska Dad
                   Alaska
                   Dad
Dad
Peace
1
                   No words
       No words
omk
       adsfd
                   adsfd
{\sf adsfd}
                   afd
afd
```

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

# **Question 4**

Correct

Mark 1.00 out of 1.00

Flag question

### **Question text**

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

## **Examples:**

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13
Output: 2
Explanation:
Pairs with sum K(=13) are \{(5, 8), (6, 7), (6, 7)\}.
Therefore, distinct pairs with sum K(=13) are \{(5, 8), (6, 7)\}.
Therefore, the required output is 2.
```

For example:

### Input Result

```
1,2,1,2,5
3
1,2
          0
```

```
Answer:(penalty regime: 0 %)
   1 a=input()
   2 b=int(input())
   3 a=set(a)
   4 a.remove(',')
   5 a=tuple(a)
    6 res=0
   7 → for i in a:
   8 -
           for j in range(a.index(i),):
              if int(i)+int(a[j])==b:
   10
                  res+=1
   11 print(res)
```

#### Input Expected Got

```
5,6,5,7,7,8<sub>2</sub> 2
13
1,2,1,2,5<sub>3</sub> 1
1
1,2
0 0
```

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

# **Question 5**

Correct

Mark 1.00 out of 1.00

Flag question

#### **Question text**

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

# Example 1:

```
Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCC","CCCCCAAAAA"]
```

### Example 2:

Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAAA"]

For example:

Input Result

AAAAACCCCCAAAAAGGGTTT AAAAACCCCCC

```
1 s=input()
 2 n=set()
3 p=set()
4 for i in range(len(s)-9):
 5
        c=s[i:i+10]
 6 🖘
        if c in n:
           p.add(c)
 8 🖘
        else:
9
           n.add(c)
10 s=list(p)
11 * for i in range(len(s)-1,-1,-1):
12
        print(s[i])
```

Input Expected Got

AAAAAAAA AAAAAAAA AAAAAAAA

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

### **Question 6**

Correct

Mark 1.00 out of 1.00

Flag question

#### **Question text**

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

#### Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

Explanation: We cannot type "world" because the 'd' key is broken.

#### For example:

	Input	Result
hello world ad		1

Faculty Upskilling in Python Programming  $_{\rm 2}$  ak

```
1 import re
 2 a=input()
3 a=a.lower()
4 b=input()
 5 b=b.lower()
 6 c=re.findall(r'[a-z]+',a)
7 d=re.findall(r'[a-z]',b)
8 res=0
9 * for i in d:
10 🖘
       for j in c:
11 ∞
           if i not in j:
12
              pass
13 🔻
           else:
14
              c.remove(j)
15 print(len(c))
```

Marks for this submission: 1.00/1.00.

# **Question 7**

Correct

Mark 1.00 out of 1.00

Flag question

#### **Question text**

Given an array of integers nums containing n + 1 integers where each integer is in the range [1, n] inclusive. There is only one repeated number in nums, return this repeated number. Solve the problem using set.

#### Example 1:

```
Input: nums = [1,3,4,2,2]
Output: 2
Example 2:
Input: nums = [3,1,3,4,2]
Output: 3
```

For example:

#### Input Result

1 3 4 4 2 4

```
1 a=input()
2 a=tuple(a)
3 n=tuple(i for i in a if i.strip())
4 b=set(a)
5 → for i in b:
6 -
       if n.count(i)>=2:
7
           print(i)
8
           break
```

#### **Input Expected Got** 1 3 4 4 2 4 1 2 2 3 4 5 6 7 2 2

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

# **Question 8**

Correct

Mark 1.00 out of 1.00

Flag question

### **Question text**

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

#### Input Result

01010101010 Yes

010101 10101 No

```
Answer:(penalty regime: 0 %)
  1 a=input()
  2 b=set(a)
  3 c={'1','0'}
  4 - if c==b:
  5
         print("Yes")
  6 ▼ else:
         print("No")
```

# Input Expected Got

Yes

REC123 No No

010101 10101 No No

Passed all tests!

01010101010 Yes

Correct

Marks for this submission: 1.00/1.00.

# **Question 9**

Correct
Mark 1.00 out of 1.00
Flag question

### **Question text**

# Check if a set is a subset of another set.

Example:

Sample Input1:

mango apple

mango orange

mango

output1:

yes

set3 is subset of set1 and set2

input2:

mango orange

banana orange

grapes

output2:

no

### For example:

# Test Input Result

- mango apple yes
  mango orange set3 is subset of set1 and set2
- mango orange 2 banana orange No grapes

Test	t Input		Expected			Got		
1	mango apple mango orange mango	yes set3 is	subset of set	1 and set2	yes ?set3 is	subset of	set1 and	set2
2	mango orange banana orange grapes	e No			No			

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Correct
Mark 1.00 out of 1.00

Flag question

#### **Question text**

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

### Sample Input:

5 4

12865

2 6 8 10

**Sample** Output:

1 5 10

2

Sample Input:

5 5

12345

#### Sample Output:

#### NO SUCH ELEMENTS

For example:

```
Input Result

5 4
1 2 8 6 5 1 5 10
2 6 8 10

5 5
1 2 3 4 5 NO SUCH ELEMENTS
1 2 3 4 5
```

Answer:(penalty regime: 0 %)

```
1 import re
 2 a=input()
3 b=input()
4 c=input()
 5 b=(re.findall(r'[0-9]+',b))
6 c=(re.findall(r'[0-9]+',c))
7 b=set(b)
8 c=set(c)
9 d=b^c
10 b = \{0\}
11 \, \text{\tiny T} for i in d:
b.add(int(i))
13 b.discard(0)
14 b=list(b)
15 b.sort()
16 * if len(b) == 0:
17
       print("NO SUCH ELEMENTS")
18 ⇒ else:
19
       print(*b)
20
        print(len(b))
```

# Feedback
